Selecting the Right Pump

Because the pump is the “heart of the liquid system” on equipment, careful consideration must be made in selecting the right pump. Seldom is there only one pump that will do the job. To make a wise choice, you will need to know about pump types, how the pump is driven, and the flow and pressure requirements for your specific spraying system and application.

1. Pump Types

To ensure you can closely match the pump to your needs, Pentair manufactures six different types of pumps under the Hypro and SHUflo brands: centrifugal, transfer, roller, diaphragm, piston and plunger pumps.

“Positive displacement” vs. “Non-positive displacement”

Pumps can be divided into two general categories: “positive displacement” and “non-positive displacement.”

Positive Displacement – In a positive displacement pump the flow from the pump is directly proportional to the pump speed. Liquid is captured and discharged as a fixed volume per revolution of the pump shaft. This positive flow is why all positive displacement pump installations must include a relief valve and bypass line between the pump outlet and the nozzle shut-off valve. Roller, diaphragm, piston and plunger pumps are positive displacement pumps.

Non-positive Displacement – In a non-positive displacement pump a rotating impeller creates a centrifugal force that overcomes the restriction of liquid flow through the system. If the outlet is closed, the impeller continues to rotate harmlessly without damaging system components. Centrifugal and transfer pumps are non-positive displacement pumps.

Centrifugal Pumps -Spray & Transfer Applications (non-positive displacement)

In centrifugal pumps, liquid enters through the center of a rotating impeller that is driven at speeds up to 6000 RPM. Liquid is forced to the outer edge of the housing; this centrifugal force is what delivers the liquid to the nozzle. Traditionally thought of as low to medium pressure pumps, the Hypro line of centrifugal pumps can deliver from 0-150 psi (0-10 bar) and flow rates up to 440 gpm (1760 lpm). Centrifugal pumps have minimum surfaces to wear and no poppet valves, making them very durable, easy to maintain and well suited for pumping abrasive and corrosive materials. Because centrifugal pumps operate at higher speeds than the RPMs of a tractor PTO, the speed must be increased through a gear drive, belt drive, gas engine drive, or high-speed hydraulic motor drive. Pump models are specifically designed for each of these drive applications. The broad, versatile line includes models with rugged housings and components of cast iron, polypropylene, engineered plastics and stainless steel that endure the wide variety of agricultural chemicals.

Selecting the Right Pump

Diaphragm Pumps (positive displacement)

Diaphragm pumps are designed to isolate abrasive and corrosive solutions being pumped from its mechanical drive components through the use of synthetic diaphragms.

Diaphragm pumps are compact, self-priming and produce low-to-high pressures 0 to 725 psi [0-50 bar] with flow rates of 3.8 to 65.7 gpm [14.5 -260 lpm]. Driven by 540 rpm PTO, gas engine, or hydraulic motor, diaphragm pumps are used for a variety of agricultural, horticultural and pest control spraying applications.

SHURflo pumps are efficient, 12 VDC electric motor driven low pressure diaphragm pumps designed for smaller spray applications with pressures 0-150 psi [0-10 bar] and flows 0-5.3 gpm [0-20 lpm]. SHURflo pumps fit uniquely into mobile applications on ATV, home lawn care, fertilizer and pesticide equipment.

Roller Pumps (positive displacement)

The Hypro line of roller pumps are an economical choice by farmers throughout the world. The rollers revolve inside the pump housing on an eccentric profile to force spray solution through the pump which then develops pressure and flow. The roller pump offers a compact design with

mechanical simplicity to provide a low initial cost pump that is extremely versatile. They operate efficiently at PTO speeds of 540 and 1000 rpm and have a wide pressure range of up to 300 psi [20 bar] and flow rates of 2 to 62 gpm [7 to 235 lpm]. Roller pumps are self-priming and easily adapt to PTO or gas engine drives. Specific seal, roller and casting materials can be selected for compatibility with certain herbicides, pesticides, fungicides and fertilizers.

Piston and Plunger Pumps (positive displacement)

Piston/Plunger pumps have a shaft, pistons or plungers and "inlet" and "outlet" poppet valves. The design of the pump converts the rotational drive into a oscillating vertical motion. On the down-stroke, the inlet valve opens, filling the chamber with solution. On the up-stroke, the outlet valve opens, and the piston forces the solution to the nozzle. Piston pumps deliver relatively low flow rate, less than 10 gpm (40 lpm), at pressures up to 1000 psi (69 bar). Plunger pumps are designed with ceramic plungers which can operate at higher pressures up to 2000 psi (138 bar) at flows up to 4 gpm (15 lpm). The main difference of construction is in a piston pump the sealing material moves with the piston while in a plunger pump the sealing material (u-cups) are stationary with only the plunger in motion. The replaceable piston cups can be of leather, fabric or Buna-N rubber, depending on the type of solution to be sprayed. They can be driven by 540 rpm PTO, gas engine, hydraulic or electric motor. Their low volume/ high pressure capability permits use in general spraying as well as task-oriented applications such as spraying fence rows and ditches, and hydrostatic testing. Plunger pumps are used primarily for cleaning operations.

Selecting the Right Pump

2. Pump Drives

How a pump is to be driven is often a primary consideration in selecting the proper type of pump. If the power source has already been determined, the following chart may be of further help in selecting the type of pump that is best suited to your needs.

How do you plan to drive the pump?

3. Flow and Pressure Requirements

Pump pressure required is often dependent on the application. Whether it be low pressure band spraying or high pressure tree spraying, it is the application that dictates what pressure is needed to get the right performance at the spray nozzle. Once you know what pressure is desired choose a pump with extra pressure capacity due to losses in pressure as it goes through the system components (strainer, valves, elbows, hose, etc.) out to the nozzle.

How Much Pressure Do You Need?

Pressure		Flow		Pump
0-150 psi (0-10 bar)	█████→	0-1078 gpm (0-4080 lpm)	█████→	Centrifugal

Pump flow required is dependent on several factors. Application rate, width of boom or size of nozzle, speed of travel and agitation. To review your pump flow requirements follow through the calculations presented on the following pages. As with pressure you will want to choose a pump that has additional flow so that it meets your application needs over time as performance drops due to component wear.

Selecting the Right Pump

Determining Pump Flow and Pressure Requirements

Every pumping task has an optimum volume and pressure requirement. Determining that optimum (and selecting the pump that delivers it) is key to an efficient and economical spraying system operation.

Pressure requirements for agricultural pumps are dependent on both the material to be applied and application targets. Soil-applied herbicides generally require a relatively low pressure pump rating of 30-60 psi with foliar-applied herbicides at the top end of that range and slightly higher. Insecticides and fungicides can require higher pressure ratings of 100 to 500 psi. Pressure must be sufficient, in the case of heavy foliage field crops and orchard crops, to penetrate the leaf foliage. In the case of orchard crops, pressure must also be sufficient to carry material up and over as well as into the canopy.

A number of factors must be considered to properly determine the total flow you will need from your pump. They include:

- Type of spray operation (broadcast, banding, low-level, etc.)
- The chemical's application rate, ground speed, boom width, hose length, tank agitation, etc.

The spray task is the first consideration in determining flow rate and pressure needs. The following formulas and calculations may help.

Calculating agitation requirements

The pump must produce enough flow for both the application rate and tank agitation requirements. Too little agitation will not keep the solution in proper suspension and too much agitation may cause foaming. Here are rule of thumb formulas for calculating how much additional pump flow you will need for agitation.

Liquids:

$$\text{Tank volume (gallons)} \times .05 = \text{total agitation in gpm}$$
 or $\text{Tank volume (litres)} \times .05 = \text{total agitation in lpm}$

Wettable Powders and Flowables:

$$\text{Tank volume (gallons)} \times .125 = \text{total agitation in gpm}$$
 or $\text{Tank volume (litres)} \times .125 = \text{total agitation in lpm}$

EXAMPLE: If you will be spraying a wettable powder from a 100-gallon tank, proper agitation will require 12.5 gpm additional flow from the pump.

Reducing agitation flow requirements

Agitation flow requirements can be reduced by using jet agitation in the tank. Jet agitators use a venturi design to multiply agitation output. Depending on the jet agitator model and pressure, one gallon per minute input can provide two to ten gallons per minute agitation output. If your sprayer is equipped with a jet agitator, consult the operator's manual or documentation to find the output to input ratio and adjust your flow required for agitation accordingly.

Agitation Flow with Jet Agitation:

$$\text{required gpm} \times \frac{\text{input}}{\text{output}}$$
 or $\text{required lpm} \times \frac{\text{input}}{\text{output}}$

For example: If you calculate a requirement of 63 gpm of agitation and your jet agitator produces 3 to 1 output to input ratio, your pump would only need 1/3 of 63 gpm, or 21 gpm.

Selecting the Right Pump

Factor in an “Excess Flow” Requirement

It is wise to have some excess flow capacity so you will not end up with an undersized pump because actual operation conditions may cause changes in spray system performance (such as normal pump wear, operating at less than rated speeds, etc.). Hypro recommends you add an additional 20% to your calculated total pump flow requirement to compensate for these variables. Plumbing systems have a number of restrictions that will result in a pressure drop from the pump to the actual spray point. These must be taken into account and minimized.

Calculating pump flow for broadcast boom sprayers

Chemical application is measured in gallons per acre (gpa) or litres per hectres (l/ha), whereas pump flow is stated in gallons per minute (gpm) or litres per minute (lpm). To calculate the pump flow required by a broadcast boom sprayer, multiply the application rate (from the chemical label) by the sprayer ground speed. Multiply the sum by the boom width on your sprayer. Then, divide that number by 495 for US units or by 600 for metric units. As a formula, it is written like this:

Flow required for boom:

$$\text{gpm} = \frac{\text{gpa} \times \text{mph} \times \text{boom width (ft.)}}{495}$$

or

$$\text{lpm} = \frac{\text{l/ha} \times \text{km/hr} \times \text{boom width (m)}}{600}$$

The result will be the pump flow required to deliver the proper application rate at the boom’s nozzles. Then calculate your total pump flow requirement (broadcast):

Flow required for boom:	<input type="text"/> gpm
Flow required for agitation:	+ <input type="text"/> gpm
Sub-total	= <input type="text"/> gpm
Excess flow requirement:	x <input type="text"/> 1.20
TOTAL PUMP FLOW NEEDED:	= <input type="text"/> gpm

Flow required for boom:	<input type="text"/> lpm
Flow required for agitation:	+ <input type="text"/> lpm
Sub-total	= <input type="text"/> lpm
Excess flow requirement:	x <input type="text"/> 1.20
TOTAL PUMP FLOW NEEDED:	= <input type="text"/> lpm

Calculating pump flow for banding sprayers

First, multiply the band width by the number of rows to determine the total width (w). Then, multiply the application rate (from the chemical label) by the ground speed. Multiply that result by the total width (w) calculated earlier, then divide the result by 5940 for US units or 60,000 for metric units. Here’s how the formula appears:

Total band width of sprayer:

$$w = \text{rows} \times \text{band width (inches)}$$

or

$$w = \text{rows} \times \text{band width (cm)}$$

Flow required for banding nozzles:

$$\text{gpm} = \frac{\text{gpa} \times \text{mph} \times w}{5940}$$

or

$$\text{lpm} = \frac{\text{l/ha} \times \text{km/hr} \times w}{60,000}$$

The result will be the pump flow required to deliver the proper application rate at the boom’s nozzles. Then calculate your total pump flow requirement (banding):

Flow required for boom:	<input type="text"/> gpm
Flow required for agitation:	+ <input type="text"/> gpm
Sub-total	= <input type="text"/> gpm
Excess flow requirement:	x <input type="text"/> 1.20
TOTAL PUMP FLOW NEEDED:	= <input type="text"/> gpm

Flow required for boom:	<input type="text"/> lpm
Flow required for agitation:	+ <input type="text"/> lpm
Sub-total	= <input type="text"/> lpm
Excess flow requirement:	x <input type="text"/> 1.20
TOTAL PUMP FLOW NEEDED:	= <input type="text"/> lpm

Selecting the Right Pump

Calculating pump flow for hand gun spraying

For low-level spraying with a hand gun, such as for lawn and turf care, professional applicators typically “walk” the lawn at about 1,000 sq. ft. per minute or 100 sq. m per minute. That means the “gpm” or “lpm” rate of the hand gun will generally be the same as “gallons per 1,000 sq. ft.” or “litres per 100 sq. m.”

To determine your total pump flow requirement:

Flow required for gun/nozzle: _____ gallons per 1,000ft² (same as gpm)

Flow required for agitation: + _____ gpm

Sub-total = _____ gpm

Excess flow requirement: x 1.20

TOTAL PUMP FLOW NEEDED: = _____ gpm

or

Flow required for gun/nozzle: _____ Litres per 100 m² (same as lpm)

Flow required for agitation: + _____ lpm

Sub-total = _____ lpm

Excess flow requirement: x 1.20

TOTAL PUMP FLOW NEEDED: = _____ lpm

Use this same method for calculating the pump flow requirement for high pressure spraying, such as trees. Even though the application “rate” is usually a visual saturation of the tree, the known gpm or lpm factor will be the hand gun nozzle output, which is the rate you use for the calculation.

Calculating pump pressure for hand gun spraying

For most hand gun chemical spraying, 40 psi (3 bar) at the nozzle is typical. To properly select a pump that can deliver the right nozzle pressure, you must consider the normal “pressure drop” that occurs within the length of hose. The amount of pressure drop through the hose depends on hose length, hose diameter and flow rate. For example, 300' (90 m) of 1/2" hose spraying at 6 gpm (23 lpm), will have a pressure drop of approximately 120 psi (8 bar). That means you need a pump delivering at least 160 psi (12 bar) in order to ensure 40 psi (3 bar) at the nozzle.

Desired pressure at gun nozzle: _____ psi

Hose pressure loss: + _____ psi

TOTAL PUMP PRESSURE NEEDED: = _____ psi

Desired pressure at gun nozzle: _____ bar

Hose pressure loss: + _____ bar

TOTAL PUMP PRESSURE NEEDED: = _____ bar

NOTE: When determining the total pump pressure requirement for high tree spraying, you must also consider the spray height (or reach) you need to attain. Generally, pumps of up to 700 psi (50 bar) are used for this purpose.

Life Guard Silicon Carbide Pump Seals

Specially designed to prolong seal life

Side by Side Comparison

The drawing to the right represents a cross sectional view of a Life Guard Premium Silicon Carbide Seal (top) and a standard seal (bottom). There are three key differences shown in the drawing: material, mating rings and balance.

Material:

The Life Guard seal utilizes silicon carbide (SiC) for its seal surfaces (primary ring and mating ring). This is more abrasion resistant than the carbon graphite and ceramic used in standard seals. SiC also runs cooler if the pump is run dry, improving the life of the seal.

Mating Rings:

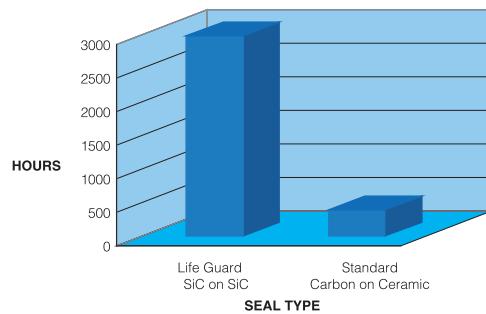

The O-ring style of the Life Guard seal mating ring allows heat to dissipate into the pump casting. This keeps the seal at a lower temperature and dramatically improves the chances of the seal to survive a dry-run episode.

Balance:

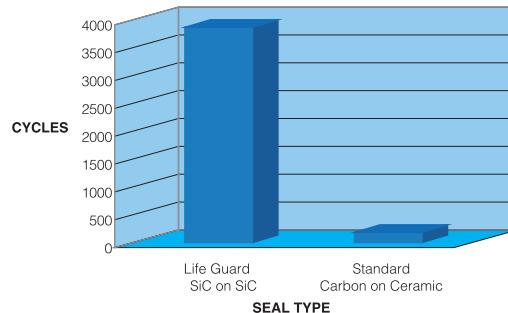

The bellows and primary ring of the Life Guard seal are pressure balanced. This results in cooler operation at higher pressures.

Life Guard silicon carbide seals are available in the following models: Pedestal mount, Flange mount, Clutch-driven, Hydraulically-driven, Belt-driven, and Gas Engine-driven.

Self-Priming Adaptor (SPA)

Provides Fast Self-Priming for Closed Impeller Centrifugal Pumps

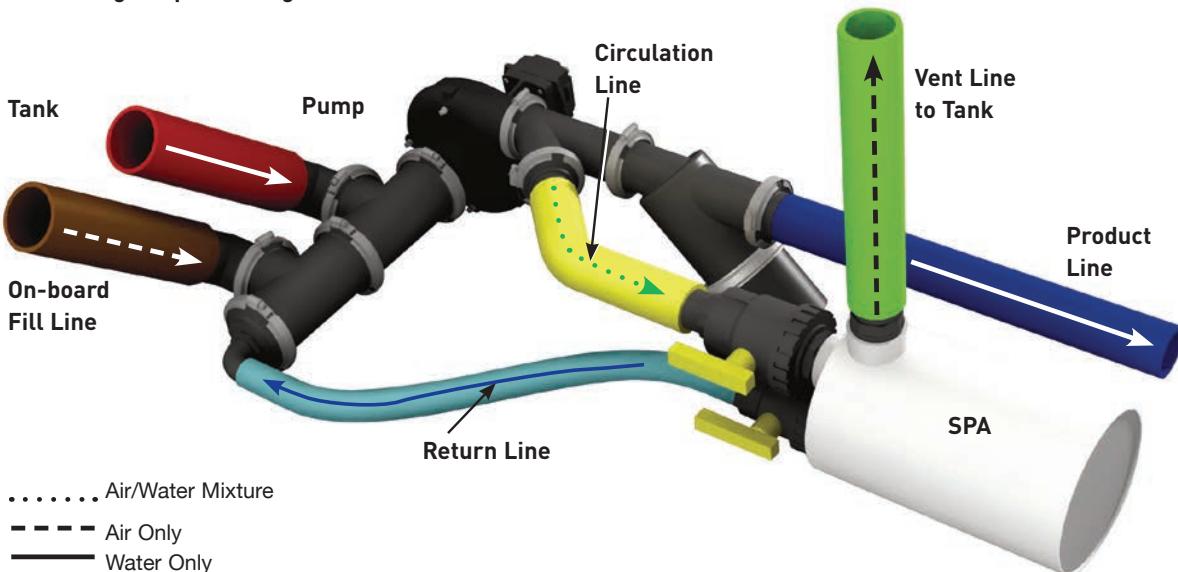

- Creates self-priming capability for all standard centrifugal pump models
- Increases priming efficiency over open impeller transfer pumps and self-priming centrifugal pumps
- Allows the use of a single, high efficiency pump for both tank filling and spraying
- Constructed out of 304 stainless steel for corrosion resistance
- Protects the pump's mechanical seal from dry-run during priming operations for on-board loading
- Guards against unexpected dry-run conditions during spraying application, if system were to function automatically
- Allows centrifugal pumps to be mounted in tight-fitting configurations while maintaining priming and flow performance capabilities
- SPA can be mounted in nearby remote location up to 10 ft (3 m) from pump

Self-Priming Adaptor Configuration

How the Self-Priming Adaptor Works

To facilitate pump priming, liquid is circulated through the pump and eye of the impeller. The attached Self-Priming Adaptor (SPA) stores an initial amount of liquid for the priming operation. The SPA, when activated with two ball valves, separates the air from the liquid being circulated and releases it back to the atmosphere through the vent line. Only liquid returns back to the pump inlet, thereby eliminating the inlet suction line of air. Once the pump is primed, pump pressure and flow increases. Flow is directed to the tank. The operator then closes the two ball valves, shutting off the circulation path between the pump and SPA.

Roller Pump Comparisons

Get up to 10 times longer pump life with Hypro Silver Series XL Roller pumps!

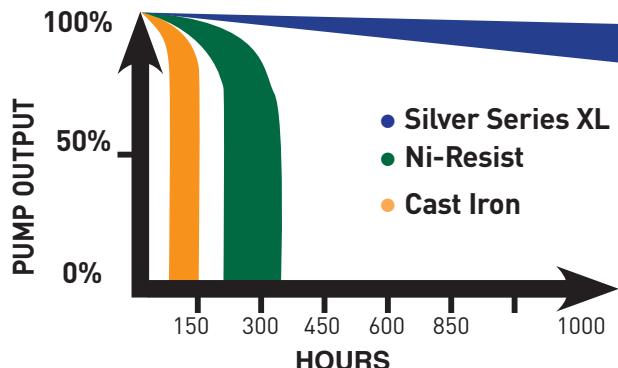

Silver Series XL

Ni-Resist

Cast Iron

These three pumps were photographed after being tested with a 30:1 mix of water and Roundup® herbicide.

The Ni-Resist and Cast Iron indicate damage from pitting and corrosion, but the Silver Series XL is in like-new condition after more than 1000 hours of use.

Herbicide users:

Get up to 10 times longer pump life!

- Cast Iron pumps lasted to 140 hours before failure.
- Ni-Resist pumps lasted to 332 hours before failure.
- Silver Series X pumps ran over 1000 hours and still met new pump specs!

Floating Design, PTFE Coating

Ni-Resist Pumps

Improvements with Hypro Roller Pumps

Floating PTFE coated rotors

- Floating rotor design and black PTFE coating on metal rotors increases performance and extends pump life
- Standard production in 4001, 4101, 6500, & 7560 Silver Series XL and Ni-Resist pumps
- Available at no additional charge

Clear Coat Finish

- Offers increased protection from chemical attack and from the elements
- Included on all Ni-Resist roller pumps
- Available at no additional charge

Poly Diaphragm Pump Series

Series 9910-DP423, DP573, and DP763

- Glass-filled polypropylene construction of head, manifold and control components for the maximum in chemical resistance
- Flow rate up to 11.5 gpm (43.3 lpm), 15.6 gpm (59 lpm) and 20.2 gpm (76.5 lpm) pressure up to 290 psi (20 bar)
- 3 cylinder design eliminates the need for pulsation dampening devices and lengthens the life of the entire pumping system
- Kynar™ and 300 series stainless steel valve design for higher flow and better corrosion resistance
- The external inlet and outlet manifold design vs. an internal manifold design allows for easy valve replacement and lower cost repairs

- Integrated pressure switch designed for the pump to work as a demand pump
- Extends the life of the pump when the duty cycle is less than 100%, for example, a 50% duty cycle extends the life of the system two times and a 25% duty cycle extends the life four times
- Reduces end-user installation charges by allowing a system to be set up for overnight charging versus continuous charging through a custom, high-amp vehicle alternator and heavy-gage wiring system

Spray Tips

Broadcast Spray Tips Page 116

- Commonly used for herbicide, insecticide, and fungicides
 - Most effective with a tapered fan, designed for spray overlap, ensuring uniformity

Broadcast Wide-Angle Flat Fan Spray Tips..... Page 140

- Commonly used with fertilizers and specialty applications
 - Wide spray pattern will overlap with adjacent patterns and improve uniformity

Streaming Spray Tips Page 146

- Commonly used for fertilizer applications
 - Single streams are good for heavy crop residues and tilled fields.
 - Multiple streams are good for crops like wheat, where minimal plant burn is required

Banding & Directed Spray Tips Page 152

- Used for various applications including agricultural spraying and orchard/vineyard spraying
 - Even spray tips are designed to eliminate spray pattern overlap;
used for spraying between crop rows or specific targeted areas

Specialty Spray Tips Page 166

- Includes boomless nozzles, specialty crops, acid-resistant tips for harsh defoliants, misting nozzles, and more

Selecting the Right Spray Tip

Visit sprayit.hypopumps.com for Hypro's online tip calculator
or download the FREE SprayIT app for Apple or Android devices.

Spray tips are often the smallest and most overlooked piece of equipment on a machine. However, they have the greatest effect on the accuracy and efficiency of each application. Hypro offers spray tips for a variety of pressure ranges, flow rates and spray patterns to fit any spray application.

To be effective, a pesticide must be applied properly. To select the correct spray tip for the job, first fully read the pesticide label and look for information on tip type, application rate, spray quality, and environmental restrictions. Then...

- 1) Check which type of spraying technique you will be using – broadcast or banding. (pg 112)
- 2) Check your sprayer speed. (pg 112)
- 3) Select the application rate from the pesticide label. (pg 112)
- 4) Determine the flow rate (GPM) needed for the spray tip, or use the application rate (GPA) chart for the desired tip. (pg 112)
- 5) Select the pattern type. (pg 113)
- 6) Select tip size and pressure that provides the desired flow rate and application rate. (pg 113)
- 7) Check the spray quality tables to be sure the spray tip and pressure create the droplet spectrum you require. (pg 113)

1) Spraying Technique:

Broadcast spraying is when the entire field is to be treated. The width that each tip sprays, adjusted for spray overlap, is the distance between tips on the spray boom.

Band spraying is when planted rows or unplanted gaps are treated. The width that each tip sprays is the width of the treated band.

2) Sprayer Speed:

Forward speed of the spraying machine should be measured accurately. Radar or ultrasound speed sensors should be calibrated after installation or servicing. Wheel-driven speedometers should be calibrated whenever the driving surface changes, such as after cultivation. Speed can be determined if it is known how long it takes to drive a measured distance:

$$\text{speed in MPH} = \frac{\text{distance (feet)} \times 60}{\text{time (seconds)} \times 88} \quad \text{or} \quad \text{speed in Kmph} = \frac{\text{distance (m)} \times 3.6}{\text{time (seconds)}}$$

Improved vehicle design means that speeds up to 20 MPH are now possible. Higher speeds (10-20 MPH) improve work rates and timeliness; lower speeds (5-10 MPH) give improved canopy penetration and make spray drift control simpler.

3) Application Rate:

Read the pesticide label closely to determine an appropriate spray application rate. If a range of acceptable application rates is listed, choose a rate that best matches your situation.

4) Flow Rate:

Determine the exact flow required from each tip by calculating:

$$\text{GPM} = \frac{\text{GPA} \times \text{MPH} \times w}{5,940} \quad \text{or} \quad \text{LPM} = \frac{\text{L/ha} \times \text{Kmph} \times w}{600}$$

'W' changes depending on the type of applications:

- Tip spacing (in/m) for broadcast spraying
- Spray width (in/m) for single-tip band spraying or boomless spraying
- Row spacing (in/m) divided by the number of tips per row for directed spraying

Or you can read the application tables throughout this guide.

Selecting the Right Spray Tip

5) Spray Pattern Type:

Flat Fan pattern – Available as a tapered spray for boom applications or an even spray for single tip applications. Even spray tips produce a narrow pattern, where spray is evenly deposited across the spray's width. Tapered spray tips produce an elliptical spray pattern where more of the spray is deposited immediately under the tip. By overlapping tapered sprays, an even distribution across the entire boom can be obtained.

Deflect pattern – Also known as anvil or flood tips, deflect tips produce a wide-angled flat pattern when operated at low pressures (10-40 PSI/1-3 BAR). The tips generally produce a coarse, even spray.

Deflect/Anvil/Flood

Cone pattern – These spray tips produce either a solid circular (full cone tips) or a hollow circular footprint (hollow cone tips). Full cones are ideal for spot spraying, whereas hollow cones are used on air-assisted sprayers and directed sprays.

Other patterns – Specialty sprays call for specialty patterns, such as off-center or streaming sprays. An off-center pattern is used to extend spray patterns past the boom structure and streaming patterns are commonly used for fertilizer applications.

Technology – Standard or Air Induction – Along with the spray pattern, it's important to consider the engineering behind each droplet. Standard droplets produce the traditional solid droplet. Air-induction technology creates air-filled droplets, which increase droplet retention and reduces the number of small droplets prone to drift.

6) Tip Size and Pressure:

Use the flow rate tables provided throughout this guide to select the tip and pressure that provides the flow needed for the application.

Selecting the Right Spray Tip

7) Spray Quality:

An important performance characteristic of a spray tip is both the size and the variation of droplets or spray quality that it produces.

ASABE S572.1 Droplet Size Classification

The American Society of Agricultural and Biological Engineers (ASABE) developed the ASABE S572.1 standard to measure and interpret spray quality from tips.

Spray Quality*	Size of Droplets	VMD Range (Microns**)	Color Code	Retention on Difficult to Wet Leaves	Drift Potential
Extremely Fine	Small	<60	Purple	Excellent	High
Very Fine		61-105	Red	Excellent	
Fine		106-235	Orange	Very Good	
Medium		236-340	Yellow	Good	
Coarse		341-403	Blue	Moderate	
Very Coarse		404-502	Green	Poor	
Extremely Coarse		503-665	White	Very Poor	
Ultra Coarse	Large	>665	Black	Very Poor	Low

*Always read the pesticide label to determine which spray quality is required.

** Estimated from sample reference graph in ASABE/ANSI/ASAE Standard S572.1.

The ASABE S572.1 standard uses eight droplet classification categories, six of which are common for agriculture and horticulture: Very Fine, Fine, Medium, Coarse, Very Coarse and Extremely Coarse. Most agrochemical applications recommend a fine, medium, or coarse spray.

BCPC Nozzle Classification

The British Crop Protection Council (BCPC) develop a standard for classifying nozzle droplet size. It was shown that to apply a spray solution safely and with the most agronomic value, a spray application needed to be delivered within the appropriate droplet size spectrum. The standard is based on relative comparisons of droplet size using a set of agreed upon reference nozzles. The BCPC standard also has an additional component that allows for further description of the drift potential of a nozzle.

For conventional hydraulic nozzles, spray quality varies according to nozzle size (defined by nozzle flow in l/min) and with pressure, larger sizes and lower pressures produce larger droplets. Spray quality is defined by Volume Median Diameter (VMD) which is the mid-droplet size where half of the volume of spray is in larger and half in smaller droplets. The BCPC International Spray Classification System, groups nozzles into five categories: VERY FINE, FINE, MEDIUM, COARSE AND VERY COARSE, each category covering a range of VMDs.

Fine Sprays	Enhance spray retention on the target. Suitable for small targets and contact acting fungicides and insecticides. There is a higher risk of spray drift with fine sprays.
Medium Sprays	The default option if no another spray quality is indicated.
Coarse Sprays	Use with residual/soil applied herbicides where drift reduction is the priority.

Air Induction (AI) nozzles incorporate air as well as fluid in the droplets. As a result they are not classified in the same way as standard hydraulic nozzles. AI nozzles tend to have a more uniform droplets size and less of the driftable fines. Those at the finer end of the spectrum can be successfully used in place of conventional 'medium' spray quality whilst at the same time reducing spray drift.

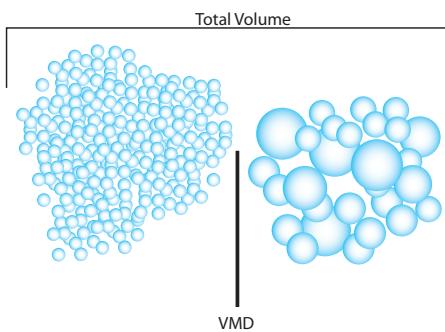

Selecting the Right Spray Tip

The following chart has been designed to simplify selection of the correct spray tip type for the agrochemical to be applied. It is based on having good conditions for spraying and should be used in conjunction with the agrochemical manufacturer's label. Increased carrier rates may allow for coarser sprays to reduce risk of drift. Always follow the agrochemical label exactly.

Understanding Droplet VMD

VMD is the droplet size at which 50% of the spray volume is in droplets larger than the VMD and 50% of the volume is in droplets smaller than the VMD (adapted from Matthews 1992).

Understanding Micron Size

Degree of Atomization	Droplet Size (Microns)	Relative Size Related to Common Objects
Fog	Up to 25	Point of a Needle (25 Microns)
Fine Mist	20-100	Human Hair (100 Microns)
Fine Drizzle	100-250	Sewing Thread (150 Microns)
Heavy Drizzle	250-500	Toothbrush Bristle (300 Microns)
Light Rain	500-800	Staple (550 Microns)
Heavy Rain	800-1000	Paper Clip (850 Microns)
Thunderstorm Rain	1000-4000	#2 Pencil Lead (2000 Microns)

Droplet sizes are usually expressed in microns (micrometers). One micron equals one thousandth of a millimeter. Other than the effects of the specific material being sprayed, the four major factors effecting droplet size are: tip style, capacity, spraying pressure and spray pattern type. Lower spraying pressures provide larger droplet sizes, while higher spraying pressures yield smaller droplet sizes. The smallest droplet sizes are achieved by air atomizing tips. Generally speaking, the largest spray droplets are produced by wide-angle, flat hydraulic spray tips. In the hydraulic spray tip series, the smallest droplet sizes are produced by hollow-cone spray tips.

Ultra Lo-Drift 120°

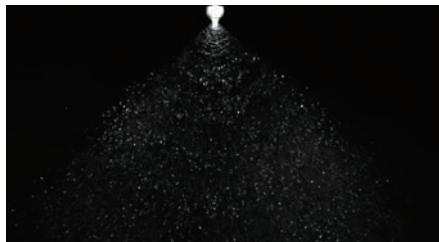

The ULD – Ultra Lo-Drift is the ideal spray tip for use where drift reduction is paramount. The tip produces large air-filled droplets, which cut drift dramatically compared with a standard fan and conventional low-drift spray tips. Ideal for use with pre-emergence and broad spectrum products.

- Creates air-filled droplets which significantly reduce spray drift
- Wide spray angle (120°) enables boom height to be lowered to further decrease drift
- Small, compact size reduces the chances of accidental breakage
- FastCap complete includes tip, cap, gasket and integrated strainers

Drift Beta 120°

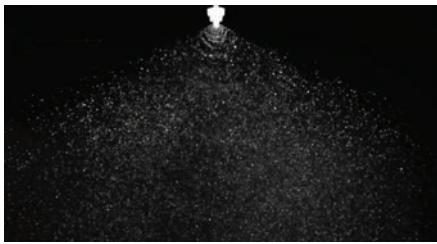

120° spray pattern with a unique balance between drift control and coverage. The Drift Beta produces a medium to larger droplet spectrum while minimizing the creation of any small droplets through its unique two piece construction.

- Air-induction technology providing reduced spray drift and improved droplet retention
- Tight control of droplets produced ensuring maximum droplet count in each spray classification
- Small, compact size reduces the chance of accidental breakage
- Available in a FastCap design for easy installation and reliable performance

GuardianAIR Twin 110°

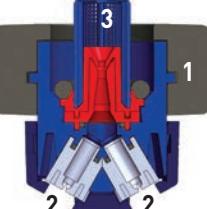

GuardianAIR Twin spray tips are the best choice for high coverage applications where on-target spray delivery is important. They are ideal for low crops with complex canopies, such as vegetables, where thorough coverage of the target and protection of the surroundings are of high importance.

- High-coverage forward and rear facing fans help penetrate complex canopies
- Engineered to provide better coverage with more drops per gallon or litre compared to other air-induced sprays
- Easy-to-install, patent-pending locking ring and o-ring seal design
- FastCap complete includes tip, cap, gasket and is available with or without a filter

GuardianAIR 110°

The Hypro GuardianAIR spray tip has a unique rearward spray incline provides more uniform coverage with 6.5 gpa (100 L/ha) spray application rates. Higher flow tips used at faster speeds have a greater spray incline.

- Air-induced sprays reduce drift while increasing droplet deposition and retention on foliage
- Provides better coverage with more drops per gallon or litre compared to other common air-induced spray tips
- Speed-optimized spray incline allows more uniform coverage
- Specifically engineered nozzle to maintain droplet spectrum regardless of orifice size
- FastCap includes tip, cap and gasket

Guardian 120°

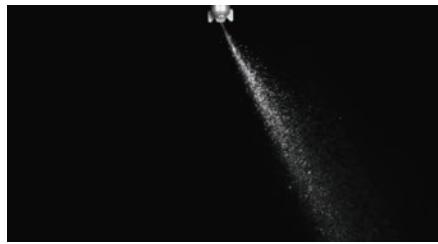

Guardian spray tips are ideal for insecticide and fungicide applications especially when used with suspension based adjuvants. The Guardian's unique 20° inclined spray pattern allows users to aim the spray rearward for general spraying, forward for vertical targets, or alternate nozzles to create a twin spray.

- Pre-orifice design for courser spray availability the flat fans
- Delivers a consistent droplet and spray pattern
- A bold arrow indicates incline direction for easy installation
- FastCap complete includes tip, cap, gasket and integrated strainers

Lo-Drift 80° & 110°

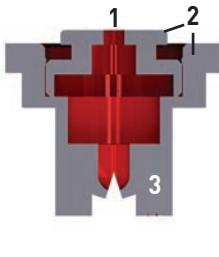

The Lo-Drift is the original drift-reducing tip. The special two-part construction includes a pre-orifice, which reduces the number of drift prone droplets.

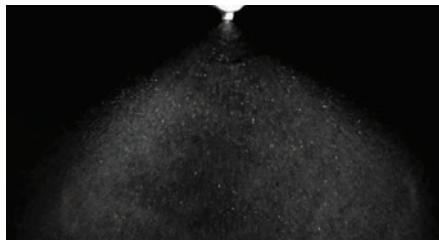

- Significantly reduces spray drift, widening the operational window
- Balanced droplet size for effective, on-target spray
- Available in acid-resistant PVDF (See page 169)

Droplet size based on ASABE S572.1 standard.

110° wide, drift reducing design that is excellent for suspension based tank mixes.

Pre-orifice design limits the formation of small droplets; reducing drift potential with a medium droplet spectrum.

See www.hydrospraytips.com/certifications for the latest drift reduction standard information.

Variable Pressure 80° & 110°

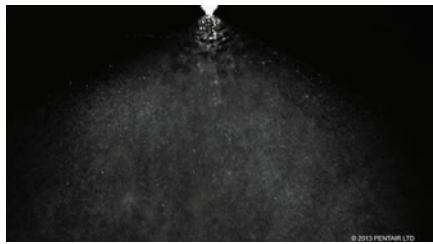

Variable Pressure tips maintain a consistent spray angle over a wide pressure range down to 15 PSI (1 BAR) and are available in 80° and 110° versions to work with different boom heights.

- Adjustable droplet size according to pressure
- Maintains good spray distribution and makes larger droplets at low pressures
- FastCap includes tip, cap and gasket
- Excellent tip for a wide variety of herbicide and insecticide applications

Low pressure performance allows for complete pattern formation and even coverage down to 15 psi [1 BAR].

Dense spray pattern of medium to fine droplets provides superior coverage.

BCPC coding: FINE (light blue), MEDIUM (medium blue), COARSE (dark blue).

ASABE droplet size based on BCPC standard.

ASABE droplet size based on ASABE S57.2 standard.

VPTech 80° & 110°

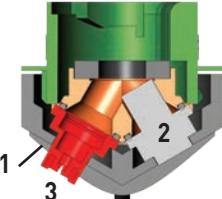

One VP nozzle and a removable blanking insert in a standard TwinCap for 30° inclined spray.

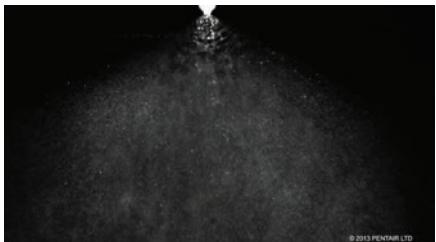

- Variable pressure tips maintain consistent spray angle over a wide pressure range down to 15 psi (1 bar)
- Available in 80° and 110° versions to work at different boom heights
- Alternate incline for optimum coverage of vertical targets

The TR (Total Range) tip series consists of a metal insert that is held in a plastic carrier. The tips are able to maintain a constant spray angle over a wide pressure range down to 15 psi (1 bar).

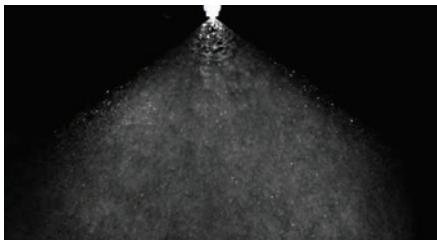

- Adjustable droplet size according to pressure
- Insert is precision-machined stainless steel and carrier is molded in tough and durable polycetal
- Maintains good spray distribution and makes larger droplets at low pressures
- FastCap includes tip, cap and gasket
- Excellent tip for insecticide and fungicide applications

FanTip 80° & 110°

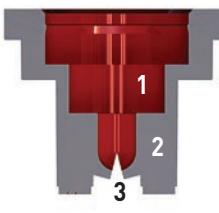

The FanTip is a general spray tip that produces a mixed droplet spectrum over the 30-60 psi (2-4 bar) operational pressure range. It is good for broadcast applications.

- Economical option for general spraying
- Simple one-piece design
- Polyacetal construction for superior product life compared to stainless steel or brass
- Available in acid-resistant PVDF (see page 168)

Droplet size based on ASABE S572.1 standard.

1. Simple; Non-Air Induced technology
2. Polyacetal; single piece design
3. Available in many sizes to meet your flow rate needs

80° or 110° wide spray patterns; broad flow range and droplet spectrum to fit many spraying applications.

Polyacetal construction provides a wear resistant orifice to ensure pattern integrity.

Ceramic AVI 80° & 110°

The Albuz® AVI draws air into the tip and mixes it with the spray to create very coarse droplets that minimize spray drift. The air-filled droplets have a larger footprint on the leaf than similar non-air droplets and hold to the leaf for better control. Durable Albuz ceramic orifice create the longest wearing spray tip of its kind.

- Excellent drift reduction with large air-filled droplets
- Large passages resist plugging
- Wear-resistant Albuz ceramic orifice
- 80° fan models ideal for use in directed spray applications
(See page 159 for more information)
- FastCap includes tip, cap and gasket

Ceramic AVI Twin 110°

The Albuze® AVI Twin (ATW) brings drift control and coverage together. Using proven AVI technology, the AVI Twin draws air into the tip, mixing it with the spray to create a twin spray of drift resistant air-filled droplets. Drift is greatly reduced, spraying the canopy with dual trajectories to improve coverage.

- Coverage-enhancing twin patterns from a single tip
- Drift-reducing AVI venturi technology
- 60-degrees of separation between fans
- Pressures from 40 to 100 psi (3-7 bar)
- Wear-resistant Albuze ceramic orifices

Hi-Flow 140°

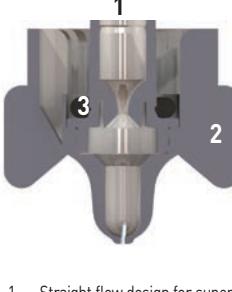

The Hypro® Hi-Flow tip is the best way to outfit a sprayer to achieve wide-angle coverage plus drift control. The 140° pattern ensures unmatched uniformity across the spray boom and allows lower spray heights to reduce the risk of drift during sensitive applications.

- Frequently used with fertilizer/herbicide mixtures for early season weed control
- Straight-through design to reduce clogging and drift
- Incredibly uniform application across the boom
- Lower spray heights and pre-orifice technology reduce drift
- Fits directly on standard nozzle bodies

Floater Adapter for Hi-Flow Nozzles

Part Number	Description
9950-0001	Floater Adapter Kit for Hi-Flow Nozzles (3/4" Cam Lock to Bayonet)

140° wide, large droplet spray pattern for industry leading coverage of liquid fertilizers.

Straight through design squeezes fluid flow to create the spray pattern versus deflecting fluid flow and creating un-needed spray drift.

DeflecTip 80°-160°

The DeflecTip wide-angle flood fan tip creates a wide pattern at very low pressures while creating mainly medium and coarse droplets. It is well suited for mounting on machinery where a wide angle or a low spray height is desired and on sprayers using very low pressures, including manual sprayers.

- Sprays at very low pressures
- Medium to coarse spray is suited for a variety of applications
- Larger sizes are suitable for liquid fertilizer applications
- Large circular orifice reduces the chances of blocking

Please note: Also available are a range of Polijet nozzles. These are flood fan tips designed for knapsack sprayers to offer spray swath widths of between 0.5 and 2.0 metres. Reference part numbers 30AN0.6, 30AN1.2, 30AN1.8 & 30AN2.4 when ordering.
Droplet size based on ASABE S572.1 standard.

Ceramic APM 80°-160°

The Albu[®] APM wide-angle flood fan tip creates a wide pattern at very low pressures while creating mainly medium and coarse droplets. It is well suited for mounting on machinery where a wide angle or a low spray height is desired and on sprayers using very low pressures, including manual sprayers. The ceramic orifice and deflector make the APM the longest-wearing flood tip.

- Sprays at very low pressures
- Medium to coarse spray is suited for a variety of applications
- Large round orifice resists plugging
- Wear-resistant Albu[®] ceramic orifice and deflector

The ESI six stream tip is designed for applying liquid fertilizer into soil seeded crops. It creates six individual streams that distribute the fertilizer on the soil while getting less on the crop. The wear resistant metering orifice and unique low pressure distribution chamber keep the streams stable to reduce atomization and prevent leaf burn and scorching. Spacing and spray height is similar to 110° broadcast tips.

- Six streams distribute fertilizer more evenly than one single stream
- Wear-resistant orifice for long product life
- FastCap includes tip, cap and gasket

Fanjet 0°

The 0-degree Fanjet regulates flow, then produces a straight stream pattern. Precision-molded in polyvinylidene fluoride (PVDF) for excellent resistance to acids and many agricultural chemicals.

- 0-degree nozzles provide a single jet of spray for streaming or injecting liquid fertilizer
- Precision-molded using chemically-resistant PVDF material
- Superior resistance to orifice wear compared to brass or stainless steel

Hollow Cone Spray Tips - Ceramic Disc & Cores 13° - 93°

Albuz® ceramic discs and cores are the longest lasting disc-core tips, making them ideal for abrasive agricultural and horticultural sprays. DCC/CRC tips will outlast stainless steel disc-core tips by up to 10 times and perform superbly at high pressures, common on many air-blast and directed sprayers.

Full Cone Spray Tips - Ceramic Discs & Cores 14°-71°

Albuz® Ceramic discs and cores are the longest lasting disc-core tips, making them ideal for abrasive agricultural and horticultural sprays. DCC/CRC tips will outlast stainless steel disc-core tips by up to 10 times and perform superbly at high pressures common on many air-blast and directed sprayers.

Boomless Flat Fan Nozzles - XT-Boom X Tender

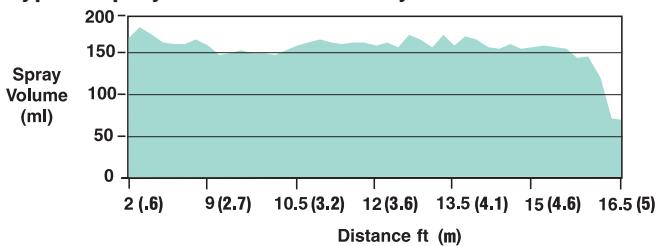

The XT introduces boomless spray technology, enabling spray to be targeted into places that conventional booms and other tips cannot reach. XT delivers a uniform spray pattern over a distance of up to 16 feet (4.9 m). Ideal for weed control in forests and pastureland.

- Ideal for applications where a conventional boom cannot be used due to obstacles
- Common uses include orchard, vineyard, forestry, pasture, turf and golf course spraying, as well as maintaining rights-of-way and fence rows
- Excellent low-drift option while extending spray reach
- Large droplet size reduces spray drift and promotes spray penetration
- Maintains a consistent spray swath over a pressure range of 30-60 psi (2-5 bar)
- Standard models with precision-molded polyacetal tip and threaded stainless steel body provide excellent durability and low maintenance

Typical Spray Pattern Produced by XT Series

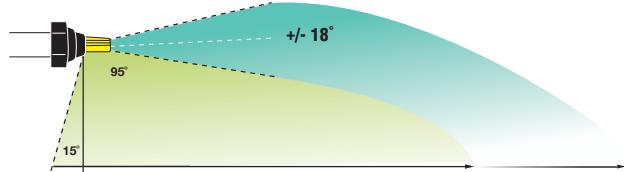

Common Uses of the Boom X Tender Spray Nozzles

Adjustable Swath Width

Swath width can be increased or decreased by adjusting the angle of the tip +/- 18°.

Boom X Tender nozzles are ideal for boomless spraying or as the last tip on a boom.

Hypro's Boom X Tender nozzles provide excellent coverage throughout the swath width for superior results.

Acid-Resistant Lo-Drift 110°

The Lo-Drift's two-part construction includes a pre-orifice, which reduces the number of drift prone droplets and makes it ideal for broadcast application of acidic defoliants.

- Acid-resistant material construction
- Significantly reduces spray drift, widening the operational window
- Balanced droplet size for effective, on-target spray

Misting Nozzles - F, HAF, PF, AFD, AF

The Hypro® range of misting nozzles produce a high percentage of droplets smaller than 50 microns making the sprays suitable for humidification and evaporative cooling. They are chemically resistant to also allow use with pesticides, disinfectants, and odor control agents as well as dust suppression.

- A variety of connection options match most applications
- Corrosion-resistant construction
- Strainers are included on many models to extend service life
- Anti-drip checks are standard in PF and AFD models

Flat Fan Spray Tips - Even 80°

For Knapsack/Backpack Sprayers

The Hypro Even Flat Fan spray tip is an excellent choice for banding and directed post application. An even spray pattern should be used when banding chemicals.

- Commonly used with knapsack sprayers for precise control
- 80° angle distributes a medium fine spray evenly across the swath
- Mixed droplet spectrum is ideal for all targets
- One piece design

DeflecTip and PoliJet 53°-127°

For Knapsack/Backpack Sprayers

The DeflecTip and PoliJet wide-angle flood fan tip creates a wide pattern at very low pressures while creating mainly medium and coarse droplets. It is well suited for sprayers using very low pressures, including manual sprayers.

- Different spray angles offer a choice of swath widths
- Low drift; coarse, even spray
- Large circular orifice reduces the chances of blocking

Spraying Solutions other than Water

Liquids that are more dense than water will flow through a spray tip more slowly than water. Solutions that are less dense than water will flow through a spray tip more quickly than water. Unless otherwise indicated, the performance tables in the spray tip section of this catalog show flow and application rates for water-based sprays. To use those tables when selecting tips to apply non-water sprays you must calculate an intermediate "look-up" application rate. To do this you will multiply your actual desired application rate by a conversion factor and then use the resulting "look-up" figure to select a tip from the water-based performance tables. The conversion factors listed on this page are based on typical values for common fertilizer solutions. For other spray solutions, you can calculate the conversion factor by taking the square root of the solution's specific gravity.

For easier tip selection using water and non-water sprays, use the SprayIT calculator online at: <http://SprayIT.hydropropumps.com>.

1.50		1.22

Example:

Your desired application rate of 28% Nitrogen fertilizer (28-0-0) is 30 US GPA.

Multiply 30 GPA by Conversion Factor 1.13 to find the converted look-up application rate of 33.9 GPA.

Select a spray tip that will apply 33.9 GPA of water-based spray. A spray tip that will apply 33.9 GPA of water will apply 30 GPA of 28-0-0 fertilizer solution.

Example:

Your desired application rate of 28% Nitrogen fertilizer (28-0-0) is 300 L/ha.

Multiply 300 L/ha X Conversion Factor 1.13 to find the converted look-up application rate of 339 L/ha.

Select a spray tip that will apply 339 L/ha of water-based spray. A spray tip that will apply 339 L/ha of water will apply 300 L/ha of 28-0-0 fertilizer solution.

EXPRESS Nozzle Body End Caps and Fittings

Conventional boom designs trap air in the boom causing a delay from the close signal to when spray actually stops. Pentair's Hypro® Express nozzle body end caps include a passive feature that eliminates the trapped air by allowing the air to escape through the nozzle body. When the boom is completely filled with liquid, the nozzle body's diaphragm check valve (DCV) activation time is greatly improved, by as much as 85%. The Express nozzle body end cap supports today's practice of Precision Agriculture by enabling standard nozzle bodies to have much quicker reaction times in response to GPS boom shut-off control signals, turning off spray quickly and decisively on overlaps, end rows, and boundary areas.

The Express nozzle body end caps also create a much cleaner look by terminating the pipe at the last nozzle body, while reducing pipe material by as much as 10%. Using nozzle body end caps will contribute to better boom hygiene by eliminating the 'dead-end' termination of pipe that allows chemical residue to build up and air to accumulate. The additional option of a removable end plug allows easy access for boom cleanout to flush debris from boom pipe.

Nozzle Body Shut-Off Controls

PROSTOP

- Rapidly and accurately start and stop nozzle flow
- Compatible with convenient push-connect air fittings and tube
- Connect one air circuit per boom section
- Air pressure activates spray, spring closure provides positive shut-off for transport and storage
- Durable and chemically-resistant polypropylene, PVDF, and EPDM components
- A 40 psi (3 bar) pneumatic signal controls a maximum spray pressure of 150 psi (10 bar)
- ProStop can be specified in place of the diaphragm check valve (DCV) on select ProFlo nozzle bodies. Add suffix "PS" to nozzle body part number shown.

Universal Flanged Gaskets

- The gasket wraparound feature provides positive alignment of the adjoining fittings and allows visual inspection to be conducted during assembly
- Provides sealing areas between fitting faces and outside diameter of flanged surfaces which increases the maximum pressure the joint can manage without leaks
- Flow can be increased by as much as 16% as the new universal flanged gasket reduces protrusion into the joint

HYPRO® Nylon® and Polypropylene Fittings

Supplemental Technical Information on Nylon and Polypropylene Fittings

Hypro Nylon fittings are generally acceptable for use at working pressures up to 150 psi (10 bar) at ambient temperatures. At very low pressures, temperatures can approach 175°F (80° C) with no degradation in the performance of the nylon fitting. Nylon has resistance to a range of chemicals including most agricultural chemicals, ammonium compounds, detergents, diesel fuel, ethanol, gasoline, hexane, magnesium sulfate, most sodium compounds, trichloroethylene, and zinc sulfate. Nylon fittings should not be used with acidic fertilizers, bromine, chlorine, fluorine, hydrochloric acid, iodine, nitric acid, phosphoric acid, sulfuric acid, or xylene.

Recommended	Not Recommended
For physical or structural strength	Acid-based fertilizers/defoliants
For broad temperature range	Xylene-based chemicals
With PTFE tape	Prolonged sunlight/UV exposure

Hypro polypropylene fittings are generally acceptable for use at working pressures up to 150 bar (10 bar) at ambient temperatures. As with all thermoplastics, an increase in working temperature is accompanied by a decrease in acceptable operating pressure. At 140°F (60°C), the working pressure limit is 6 bar. Polypropylene has resistance to a range of chemicals including most agricultural chemicals, acidic fertilizers, ammonium compounds, calcium carbonate, ethanol, hydrochloric acid, magnesium sulfate, oxalic acid, propionic acid, phosphoric acid and most sodium compounds. Polypropylene fittings should not be used with aromatic hydrocarbons, carbon tetrachloride, gasoline, hexane, kerosene, nitric acid, sodium hypochlorite, toluene trichloroethylene, and xylene.

Recommended	Not Recommended
Hand tight, plus 1 turn	Impact wrench, other over tightening
For normal ag growing season conditions	For temperature extremes
For acid resistance	With PTFE tape
For Sunlight/UV resistance	For toluene or xylene-based compounds
For cosmetic appearance

Limited Warranty on HYPRO/SHURFLO Agricultural Pumps & Accessories

Hypro/SHURflo (hereafter, "Hypro") agricultural products are warranted to be free of defects in material and workmanship under normal use for the time periods listed below, with proof of purchase.

- Pumps: one (1) year from the date of manufacture, or one (1) year of use. This limited warranty will not exceed two (2) years, in any event.
- Accessories: ninety (90) days of use.

This limited warranty will not apply to products that were improperly installed, misapplied, damaged, altered, or incompatible with fluids or components not manufactured by Hypro. All warranty considerations are governed by Hypro's written return policy.

Hypro's obligation under this limited warranty policy is limited to the repair or replacement of the product. All returns will be tested per Hypro's factory criteria. Products found not defective (under the terms of this limited warranty) are subject to charges paid by the returnee for the testing and packaging of "tested good" non-warranty returns.

No credit or labor allowances will be given for products returned as defective. Warranty replacement will be shipped on a freight allowed basis. Hypro reserves the right to choose the method of transportation.

This limited warranty is in lieu of all other warranties, expressed or implied, and no other person is authorized to give any other warranty or assume obligation or liability on Hypro's behalf. Hypro shall not be liable for any labor, damage or other expense, nor shall Hypro be liable for any indirect, incidental or consequential damages of any kind incurred by the reason of the use or sale of any defective product. This limited warranty covers agricultural products distributed within the United States of America. Other world market areas should consult with the actual distributor for any deviation from this document.

Return Procedures

All products must be flushed of any chemical (ref. OSHA section 1910.1200 [d] [e] [f] [g] [h]) and hazardous chemicals must be labeled/tagged before being shipped* to Hypro for service or warranty consideration. Hypro reserves the right to request a Material Safety Data Sheet from the returnee for any pump/product it deems necessary. Hypro reserves the right to "disposition as scrap" products returned which contain unknown fluids. Hypro reserves the right to charge the returnee for any and all costs incurred for chemical testing, and proper disposal of components containing unknown fluids. Hypro requests this in order to protect the environment and personnel from the hazards of handling unknown fluids.

Be prepared to give Hypro full details of the problem, including the model number, date of purchase, and from whom you purchased your product. Hypro may request additional information, and may require a sketch to illustrate the problem.

Contact Hypro Service Department at 800-468-3428 to receive a Return Merchandise Authorization number (RMA#). Returns are to be shipped with the RMA number clearly marked on the outside of the package. Hypro shall not be liable for freight damage incurred during shipping. Please package all returns carefully. All products returned for warranty work should be sent shipping charges prepaid to:
